As you already know you get initially two access packages. The members of these initial access package have the RBAC role "Contributor" assigned from the corresponding subscription. The members in the approver access package have in addition to the members in the contributor access package the right to grant access to accounts, managed identities and Azure AD security groups on their resource groups and in general to approve or decline requests to all access packages belonging to their subscription.

But very often you want to separate user rights in a more specific way. For instance there are users that should only can read in the subscription or should have only access to work on specific resource groups or be responsible for administer AKS clusters. In this case you can request with a gard ticket urther access packages, that provide the grants you wish to have for the corresponding members.
