

How to create a DTIT compliant function app in Azure with the az client tool

MN

Matthias NegaFebruary 13, 2023, 4:55 PM

Prerequisite:

None - all steps can be done from outside the virtual network without an admin vm.

Steps:

- i) Create a subnet inside of the virtual network that is delegated for function apps.
- ii) Create a resource group
- iii) Create a storage account and do a virtual network integration of the storage account at least into the subnet delegated for function apps created in step (i)
- iv) Create a function app service plan (min. P1V2 => 94 EURO/month) - or use an existing, but you need to create the function in the same resource group where the plan resides. Note: You need separate plans for windows and linux!
- v) Create the function app with the appropriate runtime settings.

Last but not least: write your function for this function app....

Code:

```
# Create a resource group
az group create --name <<MyResourceGroup>> --subscription <<MySubscriptionName>> --location westeurope
```

```
# create a PSA compliant storage account
az storage account create --name <<MyStorageAccountName>> --resource-group <<MyResourceGroup>> --allow-blob-public-access false \
    --allow-cross-tenant-replication false \
    --allow-shared-key-access true --location westeurope --sku Standard_LRS --bypass AzureServices --default-action Deny \
    --min-tls-version TLS1_2 --publish-internet-endpoints false --publish-microsoft-endpoints false --kind StorageV2 \
    --identity-type SystemAssigned --require-infrastructure-encryption true
```

```
# Get all Subnets to pick up the correct subnet ID for vnet integration
az network vnet subnet list --vnet-name <<MyVnetName>> --resource-
group <<MyVnetResourceGroupName>> | grep -i virtualNetworks | grep -i id
```

```
# Integration of the storage account into the subnet delegated for function apps
az storage account network-rule add --account-name <<MyStorageAccountName>> --
resource-group <<MyResourceGroup>> \
--subnet <<MySubnetIdFromTheCommandBefore>>
```

```
# create function app service plan - For SKU see https://learn.microsoft.com/en-
us/cli/azure/functionapp/plan?view=azure-cli-latest
az functionapp plan create --name <<MyAppServicePlanName>> --resource-
group <<MyResourceGroup>> --sku P1V2
```

```
# get a list with runtimes
az functionapp list-runtimes
```

```
# Create function app
az functionapp create -g <<MyResourceGroup>> -p <<MyAppServicePlanName>> -
n <<MyFunctionAppName>> -s <<MyStorageAccountName>> \
--functions-version 4 --os-type <<MyOs - e.g. Windows>> --
runtime <<MyRuntime - e.g. powershell>> \
--runtime-version <<MyRuntimeVersion - e.g. 7.2>> \
--subnet <<MySubnetIdFromTheCommandBefore>>
```
