

This blog article includes the documentation and a small explanation regarding using CEIS with Azure Monitor.

Basically you have to add a webhook to an action group, that can be added to an alert.

The common alert schema must be enabled, as our gateway will transform the information from there to send it to CEIS.

The documentation/readme is available here: [CEIS - Azure - Readme Documentation.pdf](#)

If you want to use this interface, you will need an API\_Token, that we will provide for you.

For further questions, please contact us via a gard ticket.
